Entrance Control Units

Facility Security

ECU's are designed to protect your entire facility. Each unit is designed as a "Weapons Control System", and prevents access into your facility by anyone carrying metal objects or high-density plastics. This level of protection ensures that your clients and **ALL** employees are protected from outside threats and hostile takeovers.

Bandit Barriers are designed to protect a specific area. Clients and employees located outside of the area of protection are vulnerable to threats in the unprotected area. Bandit Barriers do not provide for any level of weapons detection, whether large metal objects or high-density plastics.

Portability

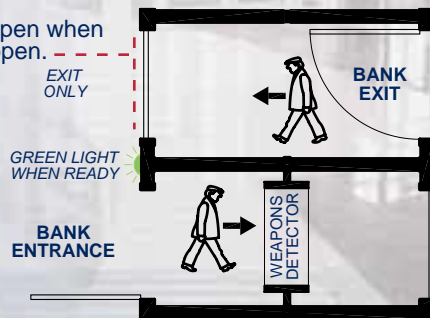

ECU's are modular and can be installed, de-installed, and re-installed within the same facility or at a completely different location. Your investment in a Hamilton Pacific ECU is not tied to a specific facility and can provide return on investment for years to come.

Facility Modifications

Entry Control Units typically require modification of the storefront glass. In most cases the existing entry doors and surrounding glass is removed to accommodate the installation of the ECU. The interior of the facility is typically unchanged with the exception of the ECU's presence in the previously open area. The area surrounding the ECU can be finished out to create a uniform appearance. Removal of an ECU is a straightforward process, and with the exception of re-installing the storefront glass and hardware, the removal is a seamless integration.

This door will not open when the inside door is open.

This door remains locked when:

- More than one person enters.
- A person is carrying a mass of metal.
- The outside entrance door is open.

"A proactive stance was taken by individual bank security departments in the installation of ... Access Control Units in their facilities. Robberies, particularly violent takeover robberies, were reduced to ... zero where access control units were installed."

Assistant Director DeSarno, FBI Los Angeles:
